

# R Test

*Student Name*

*14 November, 2014*

During this course, you might find yourself working at home and needing everything to function properly. In this short assignment, we will learn how to print a statement in R. In addition, the second half of this assignment will tell us about your computer, R, and Git environments.

1. Edit your name in the *author* line above (line 3)
2. Print a message in the R terminal

Ex. Print “*Hello, World!*”

```
print("Hello, World!")
```

```
## [1] "Hello, World!"
```

Now, print your own statement

3. Tell us about your system. Basically, just leave this part alone and it will do magic

## Do Not Modify This Part

```
info <- unname(c(Sys.info()[6],  
  .Platform$OS.type,  
  Sys.info()[1:2],  
  R.version.string,  
  .Platform$GUI,  
  system("git --version", intern = TRUE)))  
info
```

```
## [1] "Mario Muscarella"      "windows"  
## [3] "Windows"              "7 x64"  
## [5] "R version 3.1.0 (2014-04-10)" "RTerm"  
## [7] "git version 1.9.4.msysgit.2"
```
